An Introduction to Music Information Retrieval:

Musicological Implications

What it says on the tin

The promise of music information retrieval

Are we there yet?

What it really says on the inside!

The promise of music information retrieval

Are we there yet?

A Brief Professional History

J. Stephen Downie

3 July 2017

Buckle Up

A zillion more slides to go!

Some Key Facts about Me

- Curious
- Love music, its theory and its history
- World-class procrastinator
- Love extensions of all sorts
- Hate practicing
- Love collaborations
- Hate practicing

Some More Key Facts about Me

- Things I am not:
  - Computer scientist
  - Engineer
  - Musicologist
  - Musician

Some Other Key Facts about Me

- Things I am:
  - Academic
  - Administrator
  - Researcher
  - Professor of Library and Information Science
  - Pub Enthusiast

Two Big Motivators

Off to University

Misspent Undergrad….

Oops…

Flute jury time already?

What, no extensions?

I need to find something easy to play…

ASAP!!!!

Sonate

C major

J.S. Bach
BWV 1033

Andante

Allegro

Exciting New Career Opportunities

Off to UWO Library School

New Educational Opportunities

The PhD Thesis

- *Evaluating a Simple Approach to Music Information Retrieval: Conceiving Melodic N-grams as Text*

- 9354 Folksongs as test collection (McNab's modified version of the Essen Collection)

- Premise 1: Apply principle of parsimony (simple first, existing IR techniques)
- Premise 2: Enough information in an monophonic, interval-only, representation to make effective retrieval possible (highly reductionist)

Primary Components (Pt. 1)

- Music interval = letter
- N-gram of intervals = word

Experimental Factors:

- N-gram Length (4-,5-, and 6-grams)
- Query Length (6, 8, and 10 intervals)
- Query Location (*Incipit*, Random)
- Query Quality (Perfect, Error)
- Classification (Intervals grouped into class of size 3, 7, 15, and unclassified (as given))

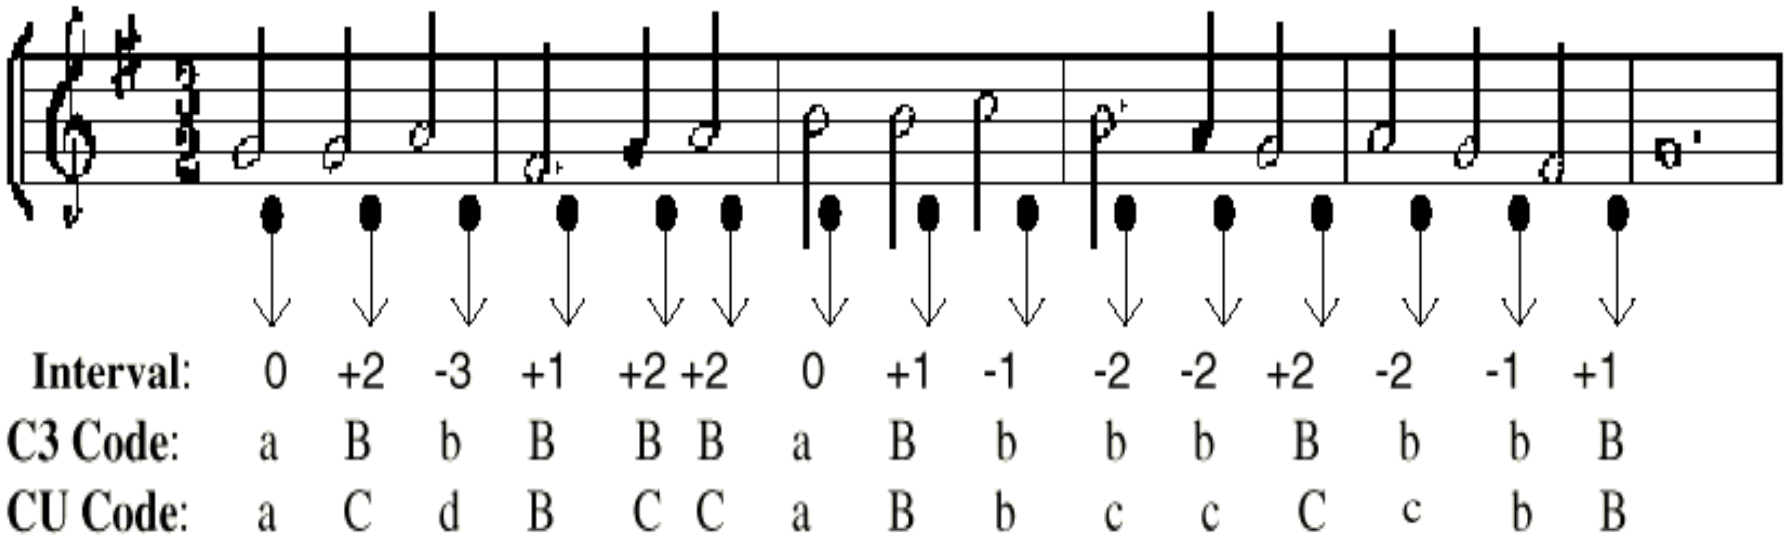
Primary Components (Pt. 2)

- Phase 1: Informetric Analyses
  - “stopwords”
  - distribution model fitting
  - term discrimination
  - entropy, etc.
- Phase II: IR Experiments
  - built test database/query set for each combination of factors
  - used Salton’s famous SMART text retrieval system
  - used traditional *tf * idf* term weighting
  - used traditional cosine correlation coefficient for ranking
  - used IR measures of normalized precision and recall

Experimental Design

				QLOC											
				Incipit						Random					
Cell N = 30				QQUAL						QQUAL					
				Perfect			Error			Perfect			Error		
				CLASS			CLASS			CLASS			CLASS		
				7	15	CU	7	15	CU	7	15	CU	7	15	CU
QLEN	6	NLEN	4												
			5												
			6												
	8	NLEN	4												
			5												
			6												
	10	NLEN	4												
			5												
			6												

Mapping Interval to Letters Example

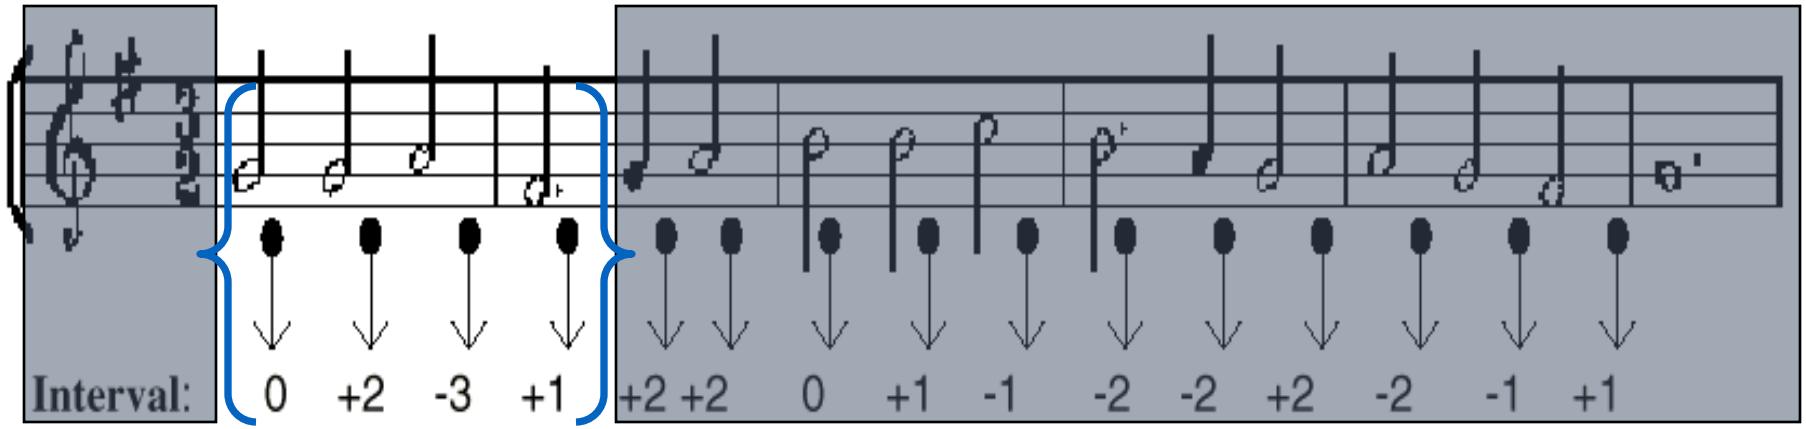


Interval:	0	+2	-3	+1	+2	+2	0	+1	-1	-2	-2	+2	-2	-1	+1
C3 Code:	a	B	b	B	B	B	a	B	b	b	b	B	b	b	B
CU Code:	a	C	d	B	C	C	a	B	b	c	c	C	c	b	B

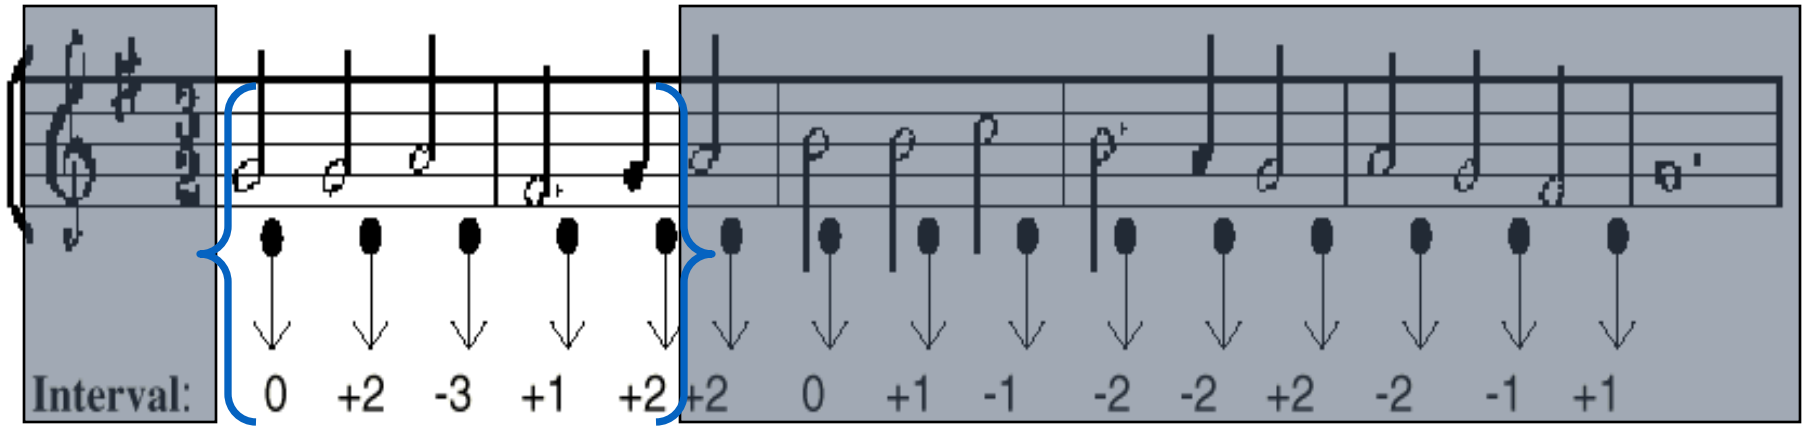
C3= Parsons' Repeat, Up, Down: Contour->Lossy, but forgiving of errors

CU=Unclassified intervals converted to alpha equivalents->Precise, but not forgiving of errors

Building the Indexes: 4-gram Window



Building the Indexes: 5-gram Window



Building the Indexes: 6-gram Window

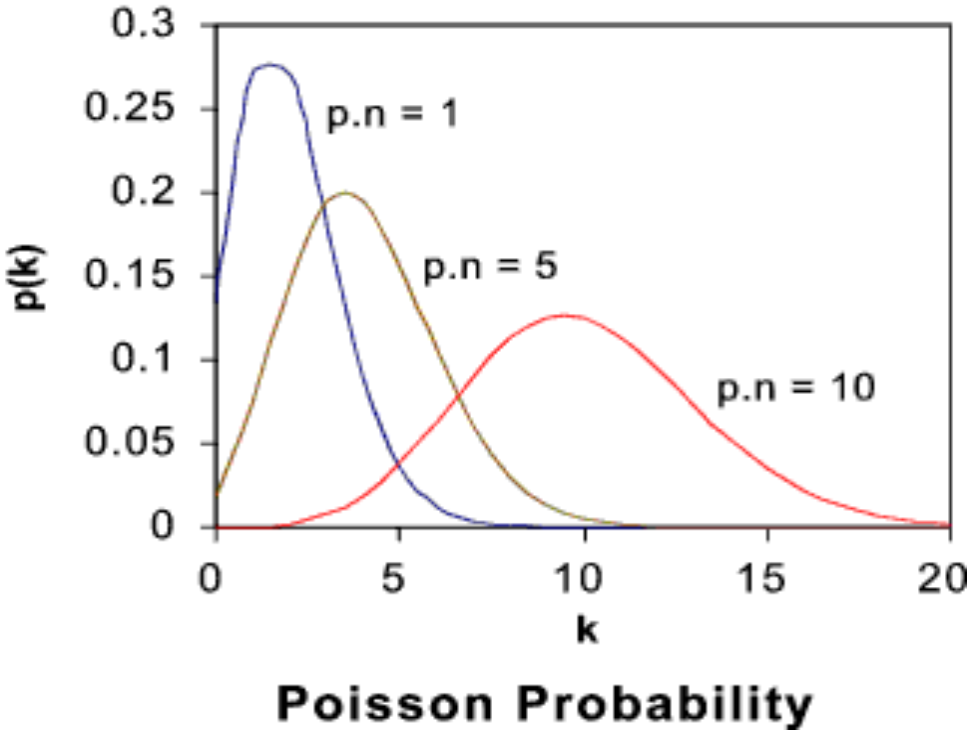
Informetric Properties: Model Fitting

Zero-truncated Generalized Inverse Gaussian-Poisson (GIGP) distribution:

$$f^*(x) = \frac{(1-\theta)^{\gamma/2}}{K_\gamma(\alpha[1-\theta]^{1/2})} \frac{(\alpha\theta/2)^x}{x!} K_{x+\gamma}(\alpha) \times \left[1 - \frac{(1-\theta)^{\gamma/2}}{K_\gamma(\alpha[1-\theta]^{1/2})} K_\gamma(\alpha)\right]^{-1},$$

$$x = 1, 2, 3, \ldots$$

where $f^*(x)$ indicates the zero truncation (as above), K_γ denotes the modified Bessel function of order γ (see Burrell and Fenton 1993), α, θ, and γ are constants determined by the data



Poisson Probability

Informetric Analyses: General Findings

- N-grams hold many similarities to text “words”
- Some combinations of n-gram length and classification scheme have properties similar to, or better than, than text:
  - GIGP model fitting
  - Term weights (IDF values)
  - Entropy values
  - Discrimination values, Lack of stopwords
- Notwithstanding the above, question remains: “What does a melodic n-gram *mean*?”

Retrieval Experiments: General Findings

- Level of fault tolerance noted with shorter n-grams
- Lack of fault tolerance using classification schemes
- Strong interaction of Query Length, N-gram Length, Query Quality
- Overall, surprisingly effective retrieval noted:
  - With errors: CUL4 index with longer queries
  - Without errors: CUL6 index with longer queries
- Notwithstanding encouraging results, data set was limited in scope and queries were simulated

Off to the Cornfields of Illinois

Important Events in MIREX (aka My) History

1999	**Music retrieval workshop at SIGIR proposed a range of evaluation scenarios**
2000	First ISMIR held at Plymouth with participants holding brainstorming sessions
2001	ISMIR at Indiana University; "Bloomington Manifesto" on evaluation published
2002	Planning grant from the Andrew W. Mellon Foundation awarded
2002	ISMIR at Paris hosted special evaluation workshop
2003	SIGIR at Toronto held Workshop on the Evaluation of Music Information Retrieval Systems
2003	Andrew W. Mellon Foundation and NSF funding awarded
2004	Audio Description Contest run at ISMIR Barcelona
2005	First MIREX plenary session held at ISMIR London
2008	NEMA project funded by the Andrew W. Mellon Foundation
2009	SALAMI funded by the NSF, SSHRC and JISC
2012	MIREX:NG project funded by the Andrew W. Mellon Foundation

Reflecting on MIREX
(A personal paradigm shift)

MIREX 2015 TASKS	
Grand Challenge 2015: Jamendo Dataset	Audio Tempo Estimation
Grand Challenge 2015: J-DISC Dataset	Audio Train/Test tasks
Audio Beat Tracking	Discovery of Repeated Themes & Sections
Audio Chord Estimation	Audio Downbeat Estimation
Audio Cover Song Identification	Query by Singing/Humming
Multiple Fundamental Frequency Estimation & Tracking	Real-time Audio to Score Alignment (aka. Score Following)
Audio Fingerprint	Singing Voice Separation
Audio Key detection	Structural Segmentation
Audio Melody Extraction	Symbolic Melodic Similarity
Audio Onset detection	Set List Identification
Music/Speech Classification and Detection

International Society for Music Information Retrieval
Membership
Contact
Who are we?
The International Society for Music Information Retrieval (ISMIR) is a non-profit organisation which, among other things, oversees the organisation of the ISMIR Conference. The ISMIR conference is held annually and is the world's leading research forum on processing, searching, organising and accessing music-related data.
The Society reports recent activities at the yearly ISMIR Community Meeting (held during the Conference). The slide deck for the 2016 community meeting may be accessed at this link.
Be a part of the Community!
Between conferences, there are multiple ways to stay involved!
Become an official member of the Society.
As a non-profit organization, members are eligible to receive discounted registration at conferences and voting rights at the annual business meeting.
Join the ISMIR Community group.
Since its inception in 2000, the ISMIR community mailing list has grown into a forum of over 1,800 members from across the world, and routinely receives announcements about conferences, career opportunities, concerts, and wide variety of other issues relevant to music information retrieval.
Get involved with Women in MIR (WiMIR) Group.
Despite the expanding reach of science and technology, there remains a stark imbalance between the number of female and male researchers in those fields. Regardless of gender or orientation, the WiMIR group is comprised of those interested in taking a more active role in building a better support system, improving visibility, and

Introduction

Description

Field	Value
Task ID	17
Task Name	MIREX 2010: Audio Chord Description - MIREX09 Dataset
Task Description	Chord transcription task requiring participants to annotate and segment the chord events in the MIREX09chord transcription dataset. Please note that: • Evaluations are performed at the triad level, • results for both pretrained algorithms and algorithms trained and tested under 3 fold cross-validation are reported here. • pretrained algorithms are likely to have been trained on the evaluation dataset hence they are expected to achieve higher results than algorithms evaluated on held out data.
Subject Metadata ID	26
Subject Metadata Name	Chord label sequence
Dataset ID	33
Dataset Name	MIREX09 Chord
Dataset Description	MIREX 2009 Chord transcription dataset composed of Christopher Harte's Beatles dataset (C4DM, Queen Mary's University of London) and Matthias Mauch's Queen and Zweieck dataset (C4DM, Queen Mary's University of London)

Non-Consumptive Research Paradigm

- *No action or set of actions on part of users, either acting alone or in cooperation with other users over duration of one or multiple sessions can result in sufficient information gathered from collection of copyrighted works to reassemble pages from collection.*
- Definition disallows collusion between users, or accumulation of material over time. Differentiates human researcher from proxy which is not a user. Users are human beings.

HTRC Portal Home About Worksets Algorithms Results HTRC Data Capsule Data Help docdownie1

Meandre_Classification_NaiveBayes

Description: This analysis will perform NaiveBayes Classification. Given a workset (that was uploaded as a csv file) containing the workset volume ids as a "volume_id" attribute and labelled data as a "class" attribute. Loads each page of each volume from HTRC. Removes the first and last line of each page. Joins hypenated words that occur at the end of the line. Uses the replacement rules (learned from our usage of Google Ngrams data) to clean OCR errors, normalize to British spelling and normalize for period spelling (or you can change this to your own custom replacement rules). Performs part of speech tagging, selecting nouns, verbs, adjectives and adverbs. Lowercase all tokens. Counts the tokens remaining for each volumes eliminating tokens with count of 1. Selects the number of attributes specified by num_attributes to use in modeling. Removes attributes that exist in only one volume and removes attributes that exist in all documents. Splits the data randomly into a training (60%) and testing (40%) set. Performs uniform discretization of frequency counts of the tokens by creating 2 equally spaced bins between the minimum and maximum for each scalar column. Creates a NaiveBayes model on the training set. Calculates the accuracy of the training and testing set and outputs the confusion matrix. Outputs the predicted value of the volumes in the training and testing sets. NOTE: The volume limit is 1000.

Version: 1.2

4th International Digital Libraries for Musicology workshop (DLfM 2017)

SATURDAY 28TH OCTOBER 2017

Shanghai Conservatory of Music, 20 Fenyang Road, Xuhui district, Shanghai 200031, China

Proceedings published in ACM ICPS

A satellite event of ISMIR 2017

NEWS

- **29 June 2017**: Following several requests, we are able to offer a short deadline extension until 3rd July 2017 (23:59 UTC-11) **for updates to papers which have already submitted their title, authors, and abstract by the 1st July 2017 (23:59 UTC-11)**. Further extensions may be available in *exceptional* circumstances, but are not guaranteed -- please contact dlfm2017@easychair.org
- **26 June 2017**: Paper submissions close at the end of *this week* on 30 June! Registration for the workshop will open in August. For those attendees looking to arrange local accommodation, the location for DLfM 2017 is confirmed as the Shanghai Conservatory of Music, 20 Fenyang Road, Xuhui district, Shanghai 200031, China.
- **19 June 2017**: We are now accepting paper submissions on easychair. Authors can submit until Friday 30th June.
- **25 May 2017**: We are pleased to announce that the DLfM 2017 proceedings will again be published in the ACM Digital Library as part of the ICPS series.

CALL FOR PAPERS

In 2017 DLfM calls for paper submissions to two tracks: a 'proceedings track' for short and full papers which will be presented at the workshop and published in the workshop proceedings; and a 'Transforming Musicology challenge' track for presented papers and posters.

Workshop location

Shanghai is one of the most populous cities in the world, a major international gateway to China and an important academic centre, housing over thirty universities and colleges. As a location for a satellite workshop of ISMIR, it is especially convenient, being on the route

Souterliedekens are rhymed psalm translations in Dutch, set to popular tunes. They were made by the Utrecht nobleman Willem van Zuylen van Nyevelt, who is also responsible for choosing the more than 150 melodies. In this way he hoped to get the youth to sing psalm texts. The Souterliedekens were published in Antwerp in 1540. It is the first complete Psalter in any European vernacular. Nowadays we are most interested in the music: thanks to the melodies of the Souterliedekens, represented in mensural notation, we can sing many of the original secular texts. These texts are only known from sources without music, such as the Antwerp Songbook (1544). By combining the texts from the Antwerp Songbook with the melodies of the Souterliedekens we can reconstruct the popular music of the sixteenth century.
You can listen to the first stanza of all the Souterliedekens, sung by a choice of Dutch and Flemish singers, recorded in 2001 for the Repertorium of Dutch Songs until 1600.
all Souterliedekens

Songs from Under the Green Linden For his radio program Under the Green Linden Ate Doornbosch made some 5,000 recordings of old songs sung by people who had sung them in the beginning of the 20th century during work on the fields or at home, sitting 'under the green linden'. Because of the oral tradition every version is different. Listen to all our recordings of some ballads:
Daar ging een heer dikwijls van huis (A Man Went Often Away From Home - The False

The Single Interface for Music Score Searching and Analysis project (SIMSSA) is teaching computers to recognize the musical symbols in digital images of musical scores, linking materials from the shelves of libraries and museums from around the world in a single digital forum.

Our goals include:

- Creation of a 21st-century architecture for processing music documents
- Transformation of symbolic representations into searchable data
- Search and analysis tools for large digital music collections
- Public access to musical data that can be studied, analyzed, and performed

For more information, please contact Ichiro Fujinaga

Le Projet SIMSSA (Single Interface for Music Score Searching and Analysis, que l'on pourrait traduire en français par « Interface unique pour la recherche et l'analyse de partitions musicales ») a pour objectif d'apprendre aux ordinateurs à extraire les symboles musicaux de partitions musicales ayant été numérisées. Il a également pour objectif de réunir en un seul lieu virtuel les collections de bibliothèques et de musées du monde entier.

Nos objectifs incluent :

- créer une infrastructure du XXIe siècle pour le traitement de partitions musicales;
- transformer ces partitions musicales en données recherchantes;
- développer des outils de recherche et d'analyse pour de grandes collections de partitions musicales numériques;
- donner accès à ces collections musicales afin qu'elles puissent être étudiées, analysées et interprétées.

Pour plus d'information, veuillez communiquer avec Ichiro Fujinaga

SIMSSA

- Prototype for "Google scores" minus Google
  - OMR (optical music recognition) is required for full-text search
  - Sophisticated music query (based on ELVIS)
- Access to digitized scores world-wide from a single website
- Find pages that contain scores in Google Books (HathiTrust)
  - HathiTrust: 6.8M book titles (4.7Billion pages): 612TB

What would SIMSSA provide?

- Web-based optical music recognition (OMR) system with score editors
  - Rodan (Remote Online Document Analysis Network)
    - Gamera + Aruspix (a combination of existing OMR software)
  - Verovio (open-source music engraver)
  - "Gradsourcing" to correct errors
  - Early music
- Web-based user interface to view, search, annotate, and analyze scores
  - MEI (Music Encoding Initiative)
  - Diva.js (web-based IIIF-compatible document delivery system)
  - Humdrum / music21 (analytical tools)

Wrapping Up

Almost done.

Closing thoughts

- Are we there yet?
  - No, but the pieces to make it happen are at hand
- Can MIR help musicology?
  - Absolutely
    - Need to resolve data issues
    - Perfection is the enemy of the good
    - Need to shift questions
    - Requires some mental agility
    - Need to manage expectations

THANK YOU!

Thanks to the great ISMIR, Digital Library and Digital Humanities Communities

And thanks to everyone who let me steal their slides.
